Drugs

- budesonide
- budesonide rectal
- budesonide/formoterol/glycopyrrolate inhaled
- albuterol/budesonide
- formoterol/budesonide inhaled

1 Interaction Found
See details below.

Patient Regimen

omeprazole

budesonide

Monitor Closely

- **omeprazole + budesonide**

omeprazole decreases effects of budesonide by increasing gastric pH. Applies only to oral form of both agents. Modify Therapy/Monitor Closely. Enteric-coated budesonide dissolves at pH >5.5. Also, dissolution of extended-release budesonide tablets is pH dependent. Coadministration with drugs that increase gastric pH may cause these budesonide products to prematurely dissolve, and possibly affect release properties and absorption of the drug in the duodenum.
